Introduction

Skin lesion classification is crucial for early detection and timely treatment of conditions like melanoma. By leveraging AI algorithms and robust databases, clinicians can quickly identify malignant features and streamline diagnosis.

01.

Early Detection

Timely recognition can drastically improve patient outcomes.

02.

AI Algorithms

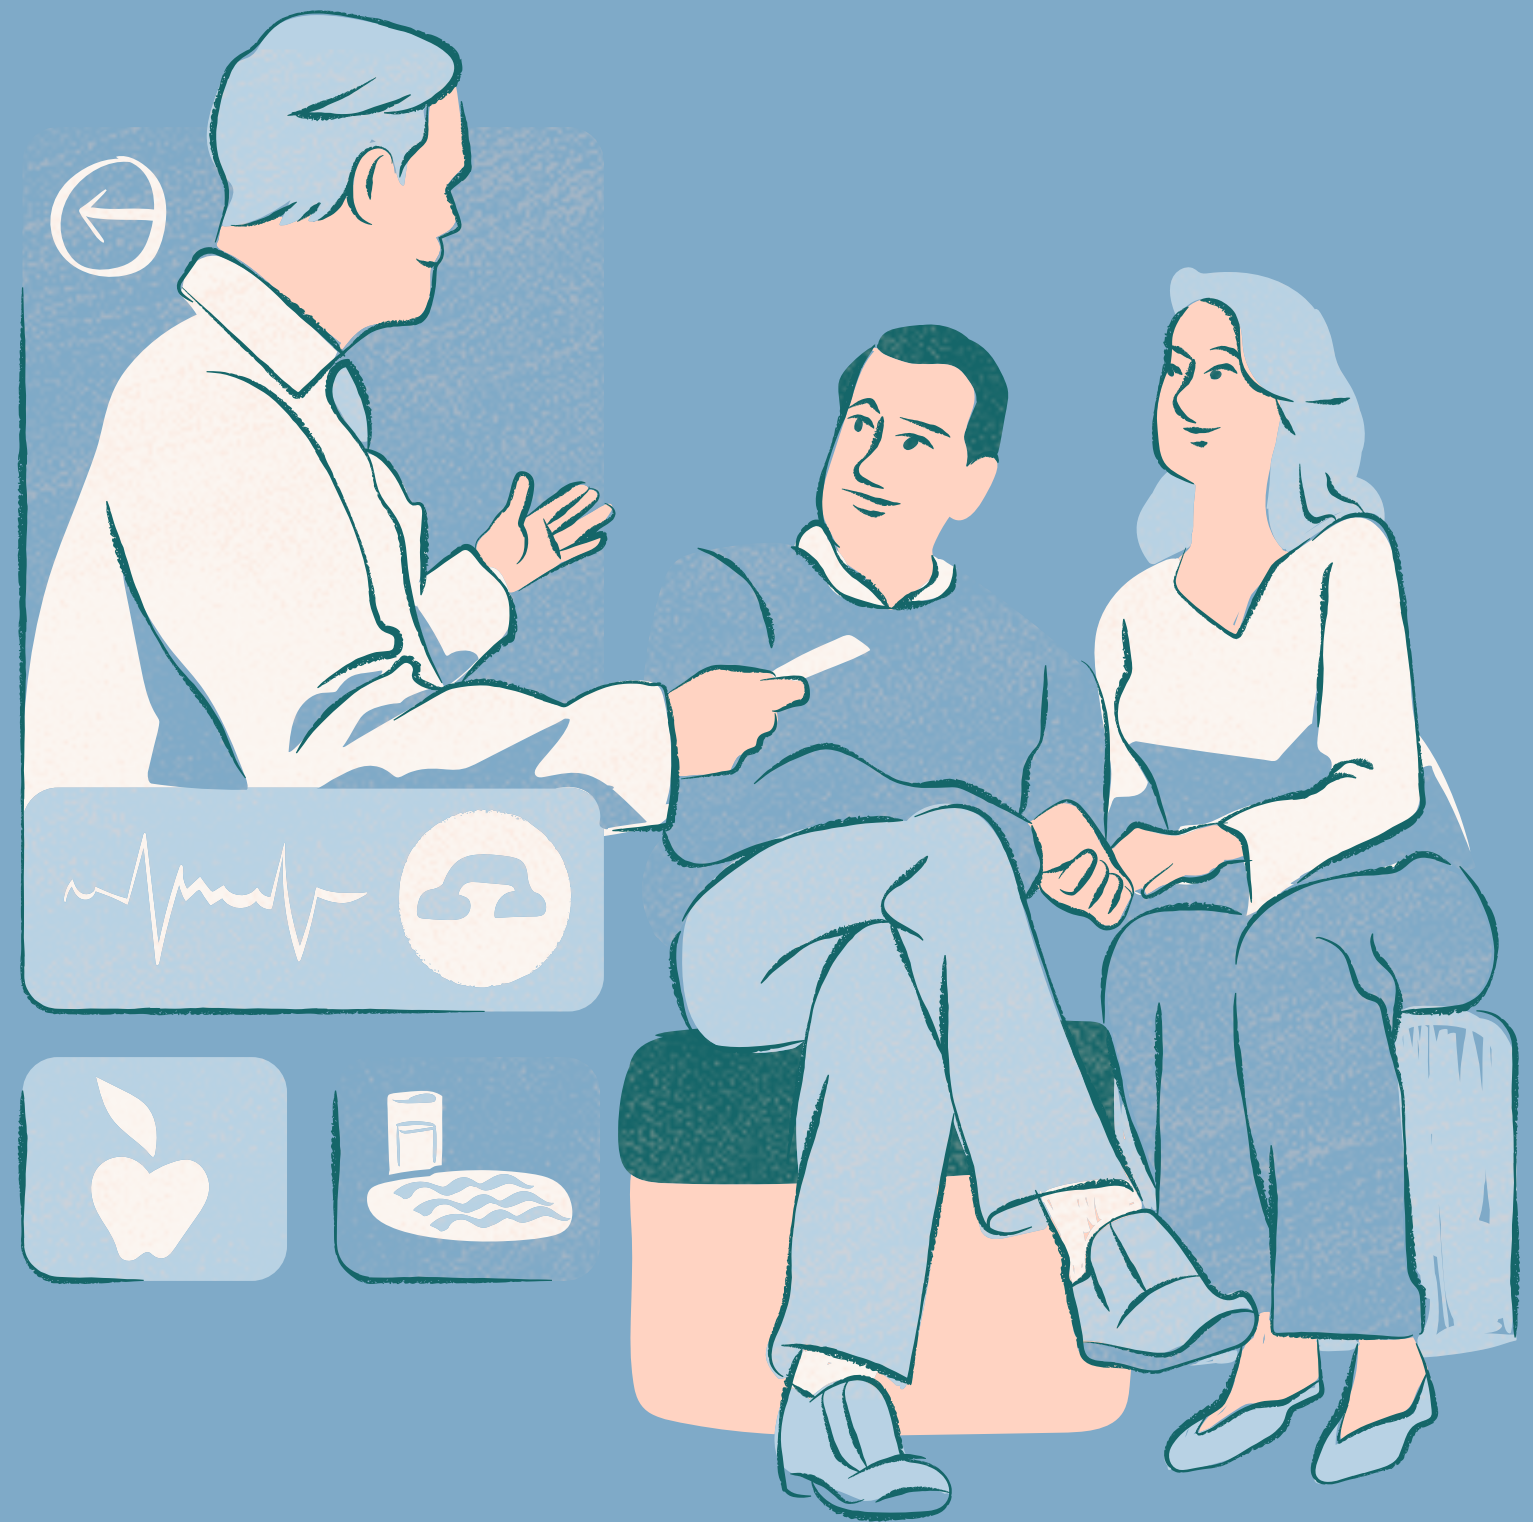

Deep learning models analyze subtle lesion patterns often missed by the human eye.

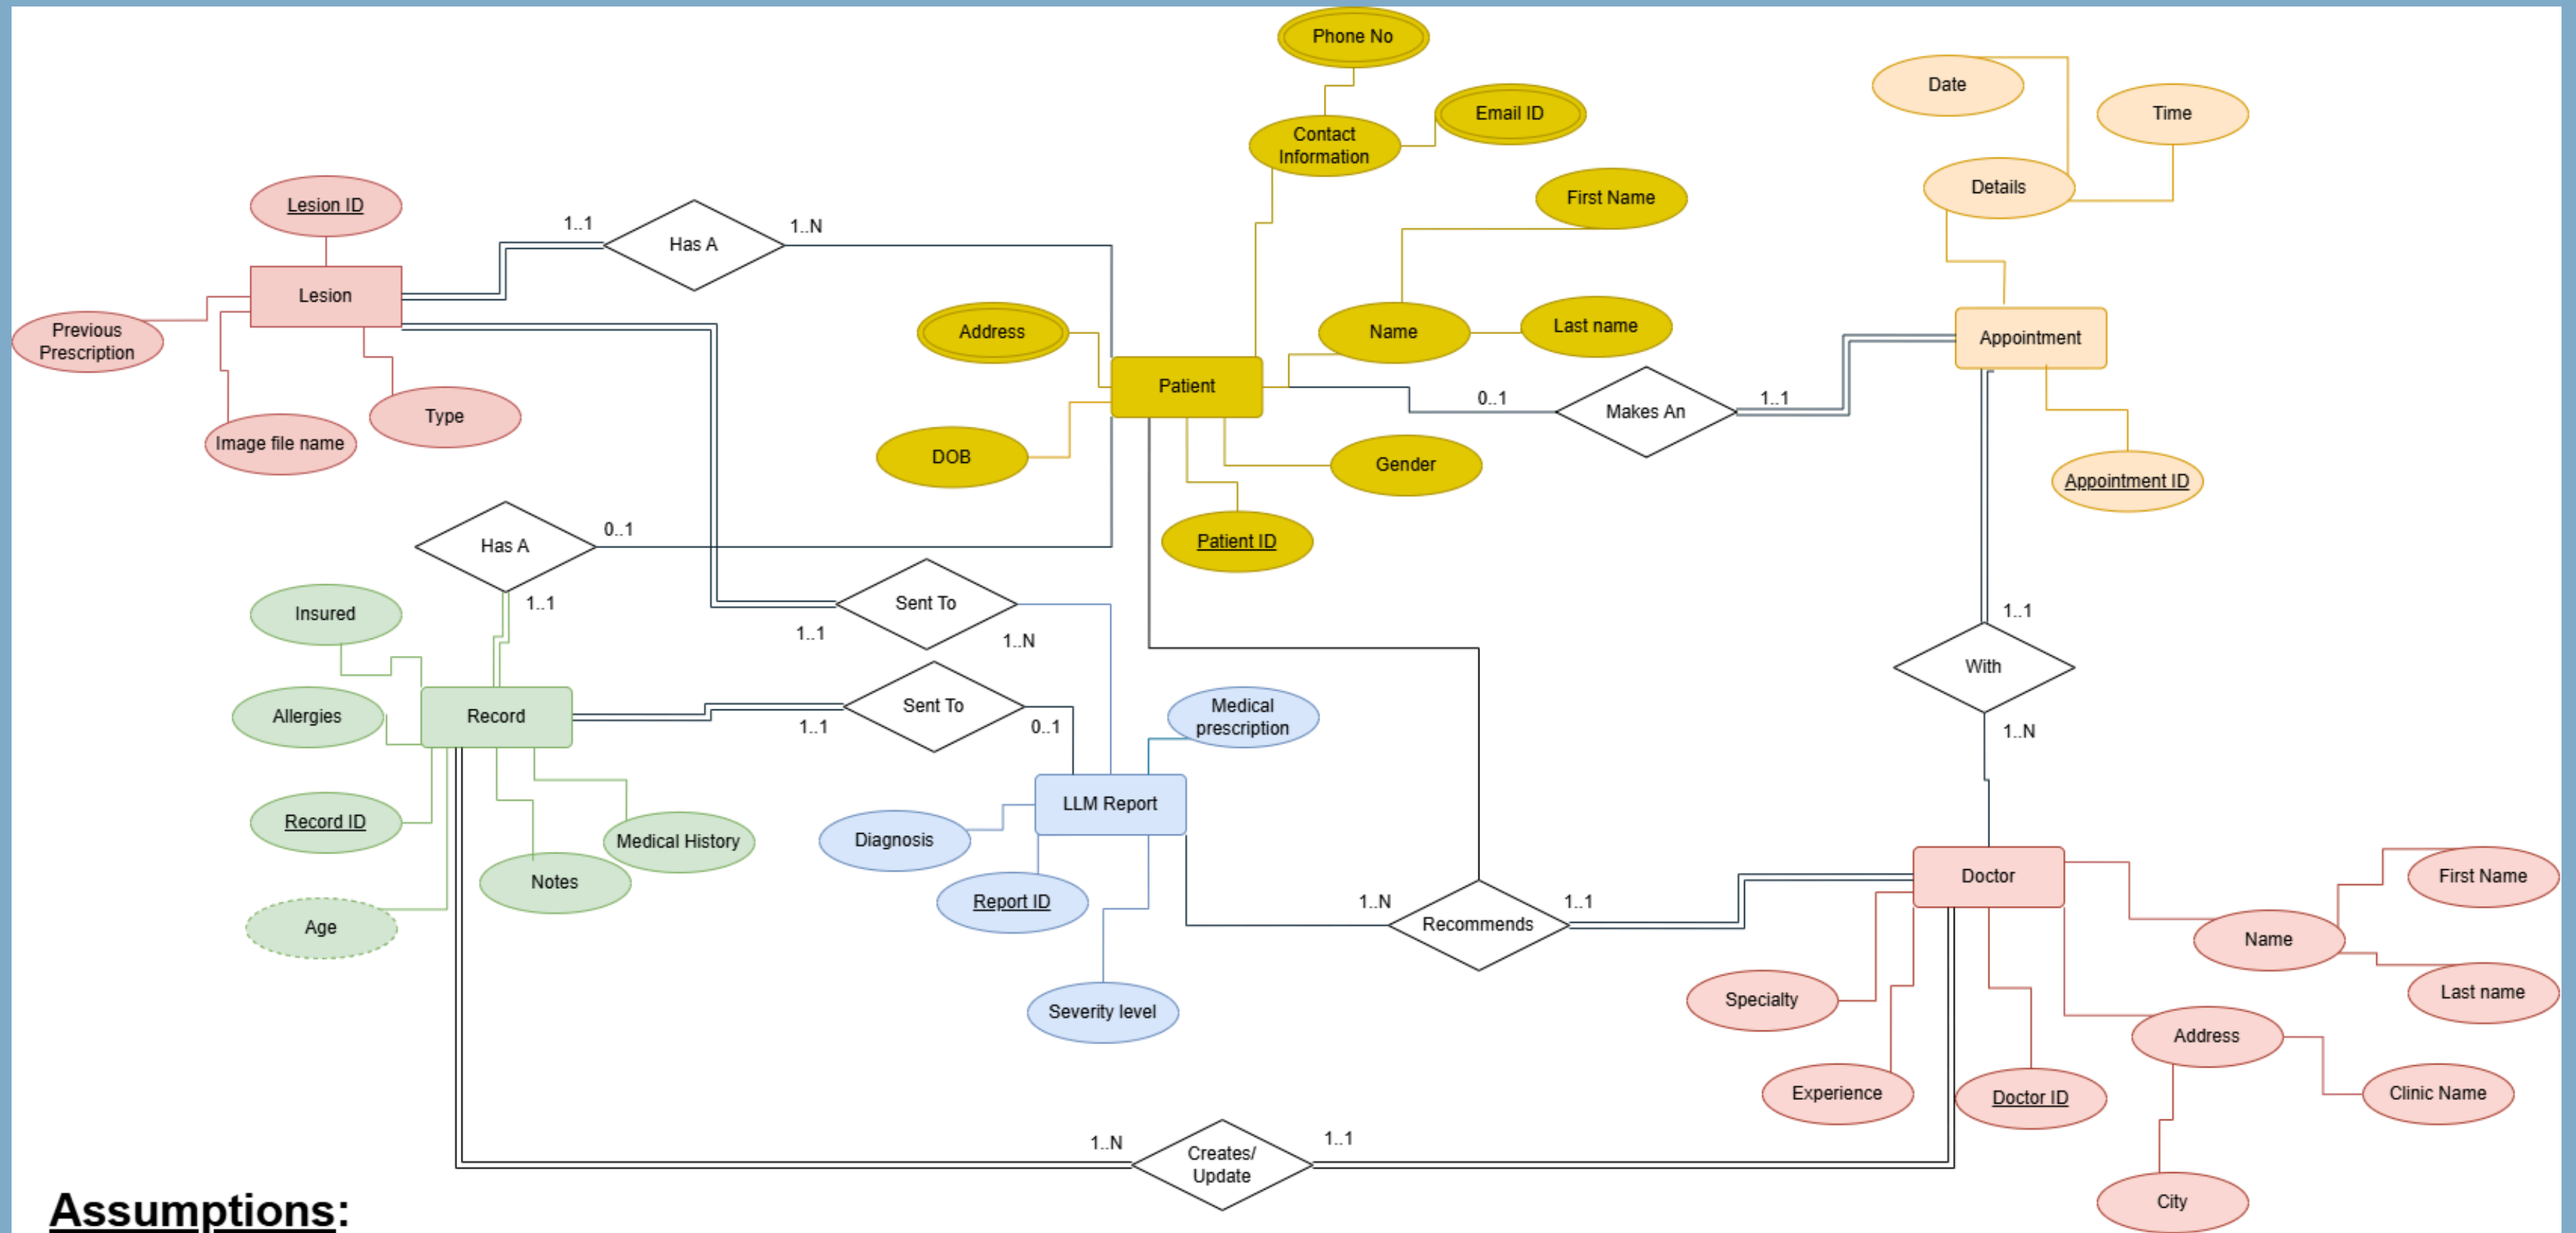

03.

Database Integration

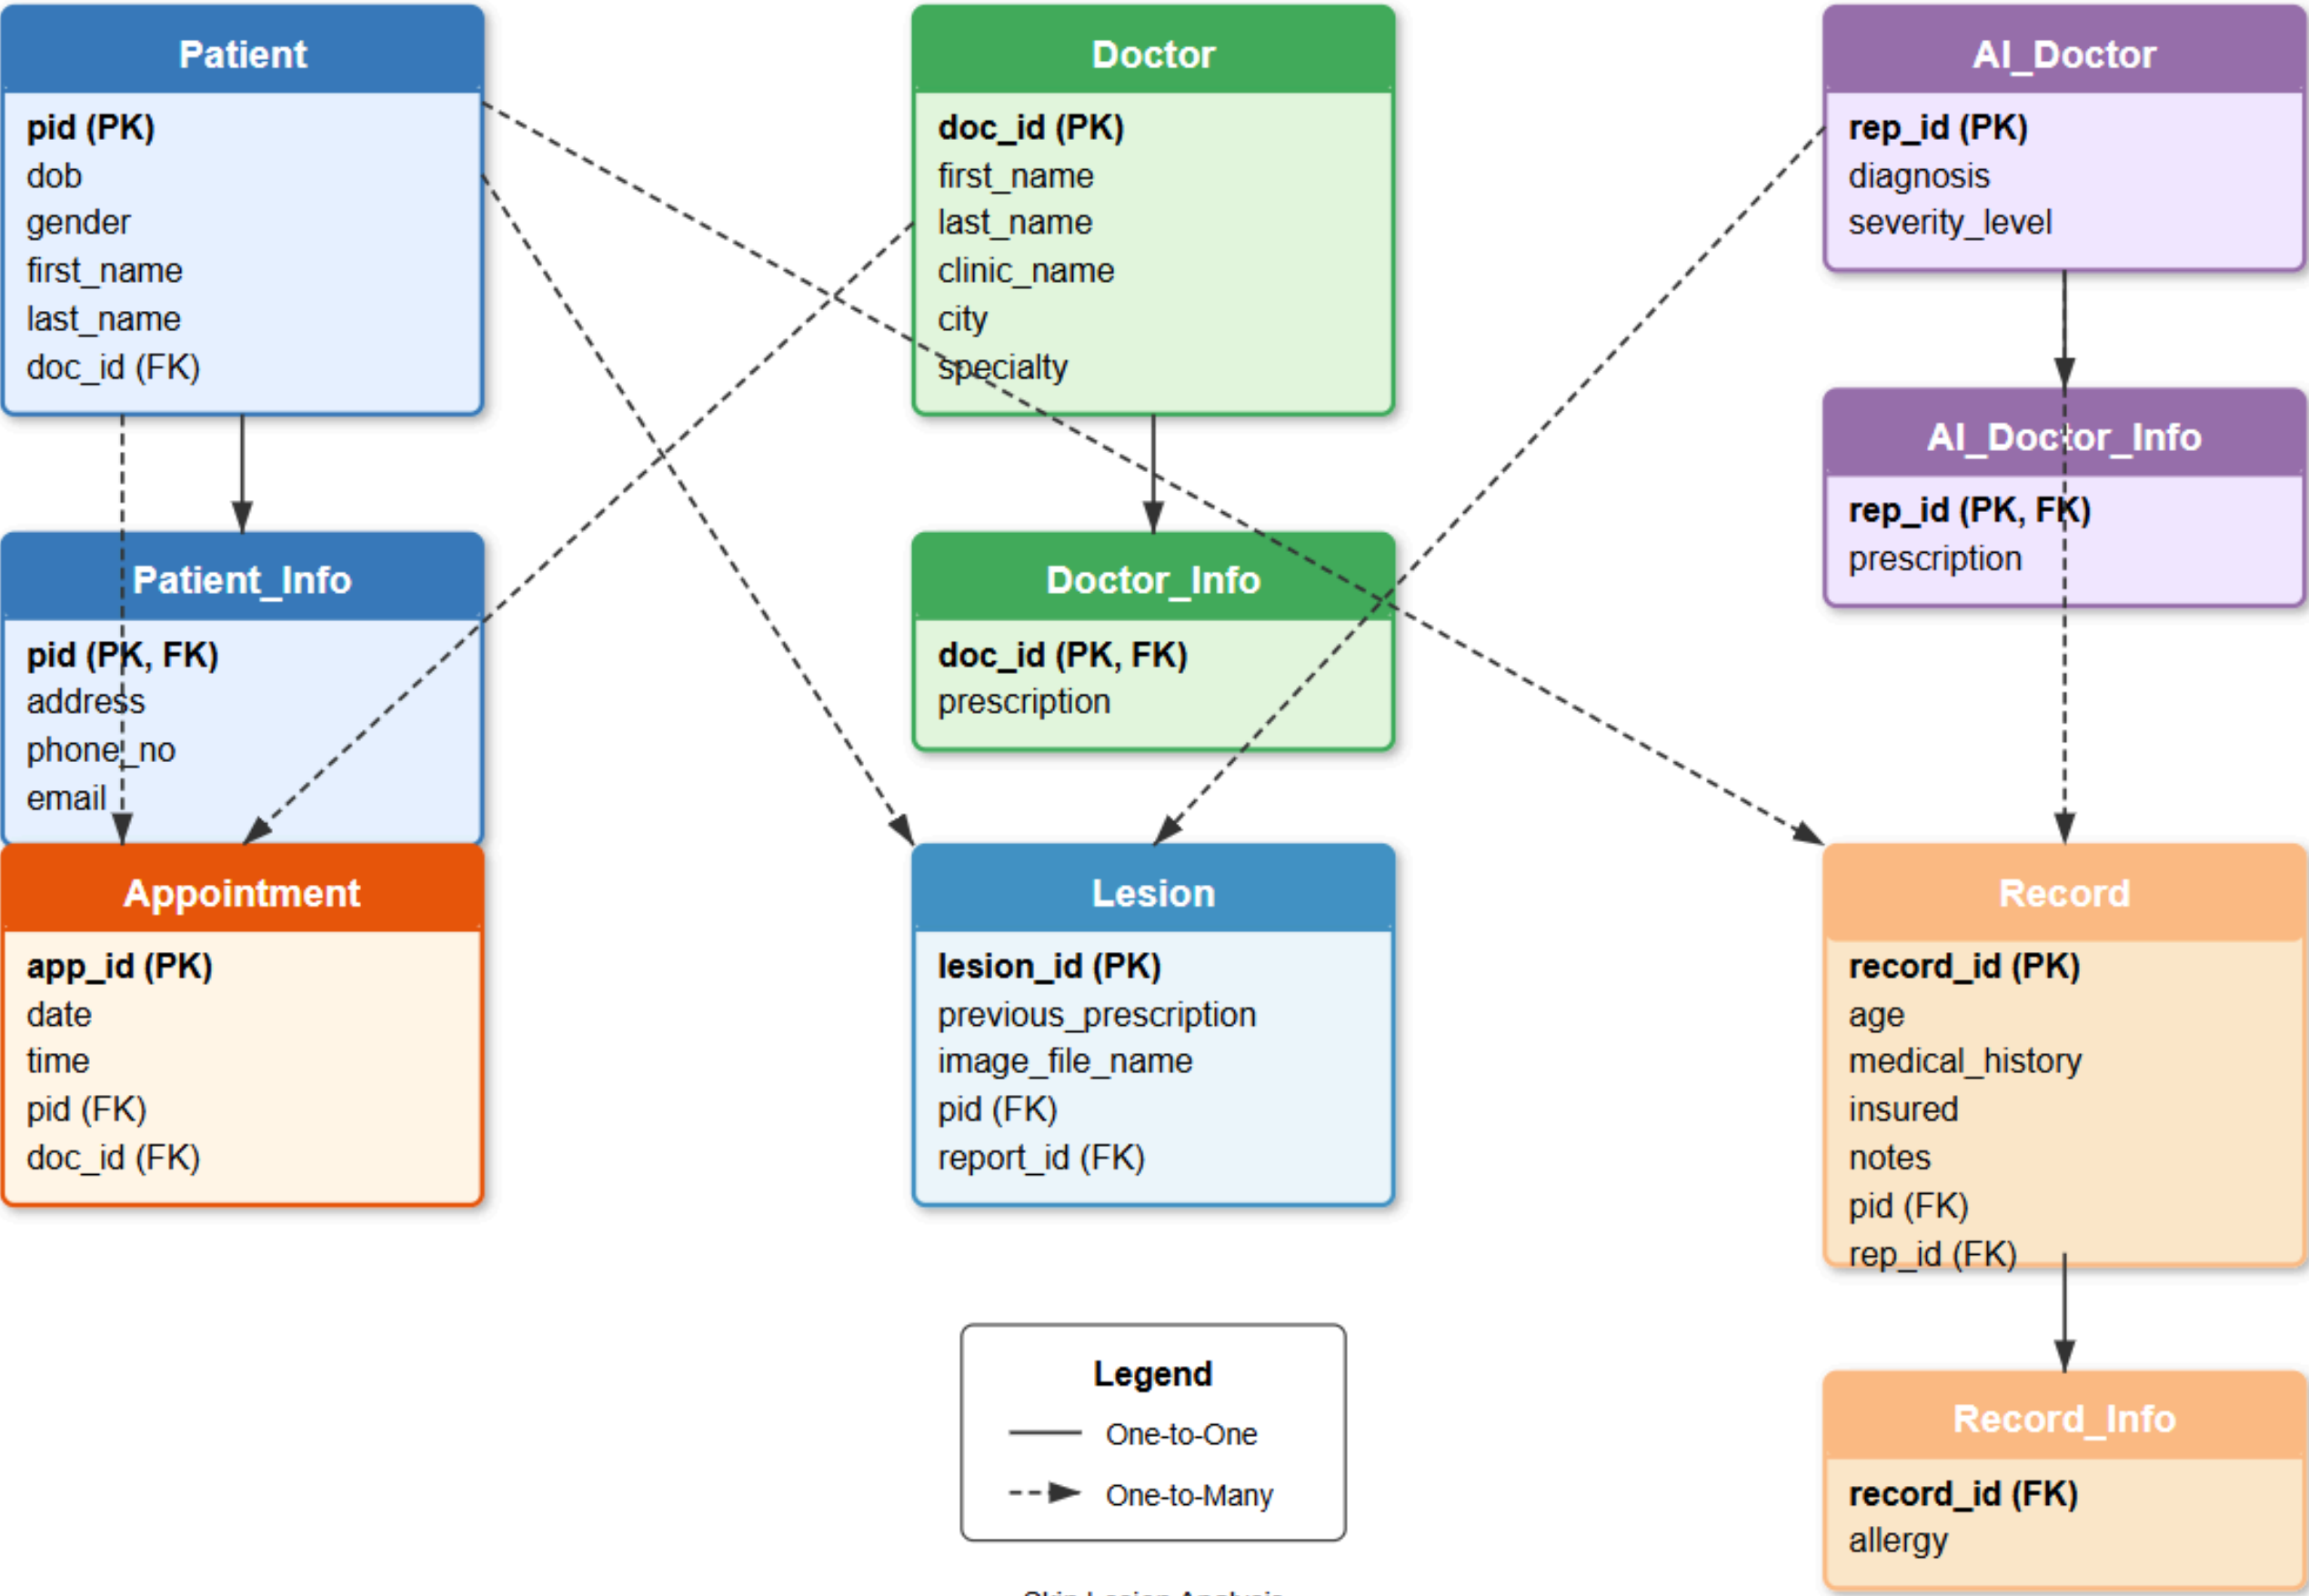

Centralized data storage and retrieval enhance efficiency and accuracy in clinical workflows.

Methodology

Database-Driven Skin Lesion Analysis System

Thank
you very
much!
